BlueCell Enterprise Features

Labor Cost Optimization

Takes the cost of labor into account during optimization. The optimizer will work to minimize the cost of the labor required based on user- defined cost criteria for various actions (e.g. loading a new board, switching materials, etc.).

Substitute materials

This feature allows you to specify a heirarchy of acceptable materials that can be substituted for the given material if it will improve the yield of a job.

Part order

For users who have an ordering system and require orders received first to be completed earlier in the optimization, parts can be optimized to appear in the patterns first before BlueCell will optimize the next order.

SQL import/export wizard

Import and export data from BlueCell. Multiple import/export actions from multiple datasources can be executed with a single click (pull sheets from one database into BlueCell, another to import parts from a different database).
